

In the Abstract:

Please amend the Abstract as follows:

A method of forming a multiple food product container for dispensing one food product from at or near one region of the container, and dispensing another food product at or near the other region of the container, is provided. In the method the two containers are coupled together (i.e., permanently or separably coupled). A preferred embodiment comprises an upper food compartment, a lower food compartment, wherein a top of the lower food compartment is coupled to a bottom of the upper food compartment, a resealable opening disposed at a top of the first food compartment, a resealable second opening disposed proximate a bottom of the second food compartment, a first food disposed in the upper food compartment, and a second food disposed in the lower food compartment.
